The screenshot shows the Gale Academic OneFile Select website. At the top, it displays 'My Library: PT. Piranti Kharisma Pratama' and navigation options like 'Change Databases', 'English', and login buttons for Google and Microsoft. The main header features the 'GALE' logo and the title 'GALE ACADEMIC ONEFILE SELECT'. Below this is a search bar with a dropdown menu set to 'Basic Search' and a 'Search...' input field. A line points from the text 'Jenis dokumen' to the search bar area. Another line points from 'Pencarian dasar' to the search bar area. A third line points from 'Account virtual drive' to the top right corner of the page. Below the search bar, there are icons for 'Title List', 'Search History', 'Get Link', and 'Highlights and Notes'. The 'SEARCH TOOLS' section includes three options: 'Topic Finder' (with a pie chart icon), 'Subject Guide Search' (with a list icon), and 'Publication Search' (with a book icon). Each tool has a brief description and a 'Go to' link. At the bottom, the Gale logo is on the left, and a footer contains links for 'ABOUT | HELP | DICTIONARY | CONTACT US | TERMS OF USE | PRIVACY POLICY | ACCESSIBILITY | END SESSION' and the 'EMPOWER' logo on the right. A small note at the bottom right states: 'Gale Academic OneFile Select contains 53,909,441 articles. Updated August 04, 2019.'

The article text includes an introduction: "Passed in 1973, the U.S. Endangered Species Act (ESA) includes strong protections for listed threatened and endangered species and has helped stabilize and recover hundreds of listed species, such as the bald eagle and gray whale (Taylor, Suckling & Rachlinski, 2005; Schwartz, 2008; Suckling et al., 2016). In part because of its strong protections, the ESA has engendered substantial opposition from industry lobby groups, who perceive the law as threatening their profits and have been effective in generating opposition to species protections among members of the U.S. Congress. One common refrain from opponents of the ESA in Congress and elsewhere is that the law is a failure because only 2% of listed species have been fully recovered and delisted (Bishop, 2013). The number of delistings, however, is a poor measure of the success of the ESA because most species have not been protected for sufficient time such that they would be expected to have recovered. Suckling et al. (2016), for example, found that on average listed birds had been protected just 36 years, but their federal recovery plans estimated an average of 63 years for recovery. Short of recovery, a number of studies have found the ESA is effectively stabilizing or improving the status of species, using both biennial status assessments produced by the U.S. Fish and Wildlife Service for Congress and abundance trends (Male & Bean, 2005; Taylor, Suckling & Rachlinski, 2005; Gibbs & Currie, 2012; Suckling et al., 2016). In addition to recovering species, one of the primary purposes of the ESA is to prevent species extinction. Previous studies indicate the ESA has been successful in this regard (McMillan & Wilcove, 1994; Scott et al., 2006). As of 2008, the ESA was estimated to have prevented the extinction of at least 227 species and the number of species delisted due to recovery outnumbered the number of species delisted for extinction by 14-7 (Scott et al., 2006). In this study, we identified all ESA listed species that are extinct or possibly

Introduction

Passed in 1973, the U.S. Endangered Species Act (ESA) has helped stabilize and recover hundreds of listed species, such as the bald eagle and gray whale (Taylor, Suckling & Rachlinski, 2005; Schwartz, 2008; Suckling et al., 2016). In part because of its strong protections, the ESA has engendered substantial opposition from industry lobby groups, who perceive the law as threatening their profits and have been effective in generating opposition to species protections among members of the U.S. Congress. One common refrain from opponents of the ESA in Congress and elsewhere is that the law is a failure because only 2% of listed species have been fully recovered and delisted (Bishop, 2013).

The number of delistings, however, is a poor measure of the success of the ESA because most species have not been protected for sufficient time such that they would be expected to have recovered. Suckling et al. (2016), for example, found that on average listed birds had been protected just 36 years, but their federal recovery plans estimated an average of 63 years for recovery. Short of recovery, a number of studies have found the ESA is effectively stabilizing or improving the status of species, using both biennial status assessments produced by the U.S. Fish and Wildlife Service for Congress and abundance trends (Male & Bean, 2005; Taylor, Suckling & Rachlinski, 2005; Gibbs & Currie, 2012; Suckling et al., 2016).

In addition to recovering species, one of the primary purposes of the ESA is to prevent species extinction. Previous studies indicate the ESA has been successful in this regard (McMillan & Wilcove, 1994; Scott et al., 2006). As of 2008, the ESA was estimated to have prevented the extinction of at least 227 species and the number of species delisted due to recovery outnumbered the number of species delisted for extinction by 14-7 (Scott et al., 2006). Full Text:
Author(s): Noah Greenwald (1), Kieran F. Suckling (2), Brett Hartl (3), Loyal A. Mehrhoff (4)

Introduction

Passed in 1973, the U.S. Endangered Species Act (ESA) includes strong protections for listed threatened and endangered species and has helped stabilize and recover hundreds of listed species, such as the bald eagle and gray whale (Taylor, Suckling & Rachlinski, 2005; Schwartz, 2008; Suckling et al., 2016). In part because of its strong protections, the ESA has engendered substantial opposition from industry lobby groups, who perceive the law as threatening their profits and have been effective in generating opposition to species protections among members of the U.S. Congress. One common refrain from opponents of the ESA in Congress and elsewhere is that the law is a failure because only 2% of listed species have been fully recovered and delisted (Bishop, 2013).

The number of delistings, however, is a poor measure of the success of the ESA because most species have not been protected for sufficient time such that they would be expected to have recovered. Suckling et al. (2016), for example, found that on average listed birds had been protected just 36 years, but their federal recovery plans estimated an average of 63 years for recovery. Short of recovery, a number of studies have found the ESA is effectively stabilizing or improving the status of species, using both biennial status assessments produced by the U.S. Fish and Wildlife Service for Congress and abundance trends (Male & Bean, 2005; Taylor, Suckling & Rachlinski, 2005; Gibbs & Currie, 2012; Suckling et al., 2016).

In addition to recovering species, one of the primary purposes of the ESA is to prevent species extinction. Previous studies indicate the ESA has been successful in this regard (McMillan & Wilcove, 1994; Scott et al., 2006). As of 2008, the ESA was estimated to have prevented the extinction of at least 227 species and the number of species delisted due to recovery outnumbered the number of species delisted for extinction by 14-7 (Scott et al., 2006). In this study, we identified all ESA listed species that are extinct or possibly extinct to quantify the number of species for which ESA protections have failed and use these figures to update the estimated number of species extinctions prevented. This is the first study in over 20 years to compile data on extinction of ESA listed species, providing an important measure of one of the world's strongest conservation laws (McMillan & Wilcove, 1994).

Methods

To identify extinct or possibly extinct ESA listed species, we examined the status of all 1,747 (species, subspecies and distinct population segments) U.S. listed or formerly listed species, excluding species delisted based on a change in taxonomy or new information showing the original listing to have been erroneous. We determined species to be extinct or possibly extinct based on not being observed for at

https://go.gale.com/ps/rdoc?tabId=T002&resultListType=RESULT_LIST&searchResultsType=SingleTab&searchType=AdvancedSearchForm&... 1/8

by 14-7 (Scott et al., 2006). In this study, we identified all ESA listed species that are extinct or possibly

The image shows a screenshot of a Gale Academic OneFile Select article page. The article title is "Extinction and the U.S. Endangered Species Act". The authors listed are Noah Greenwald, Kieran F. Suckling, Brett Hart and Loyal A. Mahhoff, with a date of April 22, 2019. The document is from the journal "PeerJ" (Vol. 7) and published by PeerJ, Ltd. The document type is an article, 3,831 words long, with a DOI of 10.7717/peerj.8803.

A "GET LINK" dialog box is overlaid on the page, containing the text "Use this link to get back to this page." and a text input field with the URL: <https://link.gale.com/apps/doc/A583153508/EAIM?u=qlpkre&sid=EAIM&cid=3492b77>. A "Select" button is located to the right of the URL field.

The article content is partially visible, starting with the "Introduction" section. It discusses the U.S. Endangered Species Act (ESA) passed in 1973, which aims to stabilize and recover hundreds of listed species. It mentions that the ESA has engendered substantial opposition from industry lobby groups and that only 2% of listed species have been fully recovered and delisted. It also notes that the number of delistings is a poor measure of success because many species have not been protected for sufficient time.

At the bottom right of the page, there is a blue box with the text "Penanda Artikel".

The screenshot shows a web browser displaying a document page from Gale Academic OneFile Select. The document title is "Extinction and the U.S. Endangered Species Act". The authors listed are Noah Greenwald, Kieran F. Suckling, Brett Hart, and Loyal A. Mehrhoff, dated April 22, 2019. The document is from "PeerJ" (Vol. 7) and published by PeerJ, Ltd. The document type is an article, 3,831 words long, with a DOI of 10.7717/peerj.8803. A purple callout box with the text "Streaming dan download mp3" is overlaid on the page. A notification box in the center states "Document(s) have been sent to Google Drive and will appear shortly." with an "Ok" button. The page includes a search bar, navigation icons (Home, Search, Results), and a toolbar with options like Translate, Font Size, Listen, and Print. The article content includes an "Introduction" section with text about the U.S. Species Act (ESA) and its impact on species recovery. The Windows taskbar at the bottom shows the search bar, taskbar icons, and system tray with the time 2:48 PM on 05-Aug-19.

Introduction

Passed in 1973, the U.S. Species Act (ESA) includes strong protections for listed threatened and endangered species and has helped stabilize and recover hundreds of listed species, such as the bald eagle and gray whale (Taylor, Suckling & Rachlinski, 2005; Schwartz, 2008; Suckling et al., 2016). In part because of its strong protections, the ESA has engendered substantial opposition from industry lobby groups, who perceive the law as threatening their profits and have been effective in generating opposition to species protections among members of the U.S. Congress. One common refrain from opponents of the ESA in Congress and elsewhere is that the law is a failure because only 2% of listed species have been fully recovered and delisted (Bishop, 2013).
